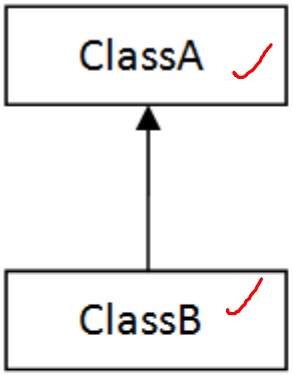
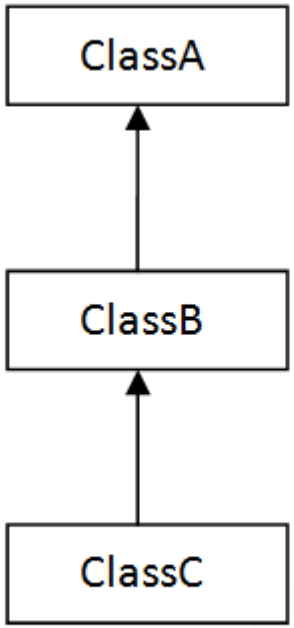
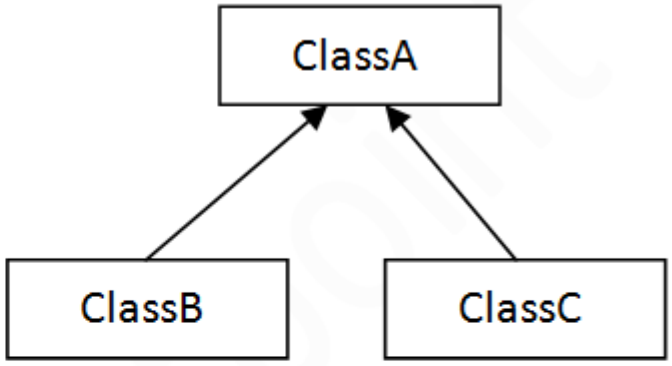
Types of Inheritance



1) Single



2) Multilevel



3) Hierarchical

Syntax of Java Inheritance

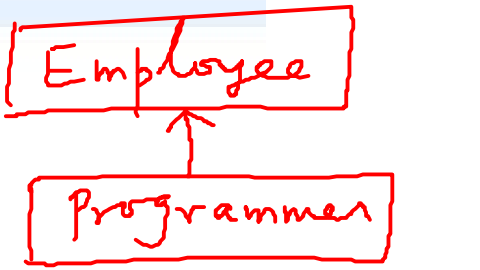
```
class Subclass-name extends Superclass-name
{
   //methods and fields
}
```

Simple or Single Inheritance

```
1  class Employee{
2   float salary=30000;
3  }
4  class Programmer extends Employee{
5   int bonus=10000;
6   public static void main(String args[]){
7     Programmer p=new Programmer();
8     System.out.println("Programmer salary is:"+p.salary);
9     System.out.println("Bonus of Programmer is:"+p.bonus);
10 }
11 }
```

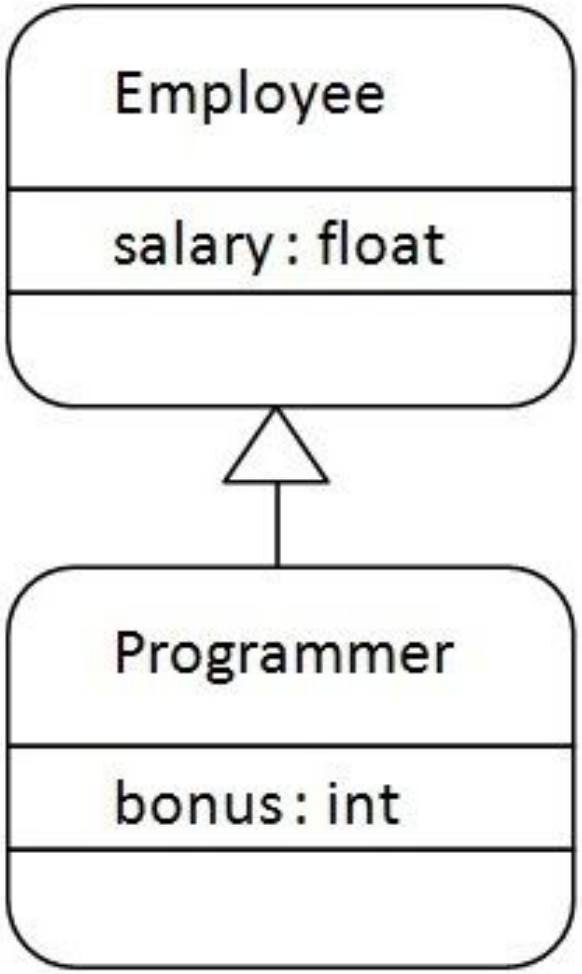
super class

subclass



```
Terminal
sh-4.3$ javac Programmer.java
sh-4.3$ java Programmer
Programmer salary is:30000.0
Bonus of Programmer is:10000
sh-4.3$
```

Understanding Simple Inheritance



Simple Inheritance

```java
class Calculation{
    int z;
    public void addition(int x, int y){
        z=x+y;
        System.out.println("The sum of the given numbers:"+z);
    }
    public void Substraction(int x,int y){
        z=x-y;
        System.out.println("The difference between the given numbers:"+z);
    }

}

public class My_Calculation extends Calculation{

    public void multiplication(int x, int y){
        z=x*y;
        System.out.println("The product of the given numbers:"+z);
    }
    public static void main(String args[]){
        int a=20, b=10;
        My_Calculation demo = new My_Calculation();
        demo.addition(a, b);
        demo.Substraction(a, b);
        demo.multiplication(a, b);

    }

}
```

Terminal

```
sh-4.3$ javac My_Calculation.java
sh-4.3$ java My_Calculation
The sum of the given numbers:30
The difference between the given numbers:10
The product of the given numbers:200
sh-4.3$
```

Understanding Pointers

```
1.  //Understanding Pointers, CSN-103, IIT Roorkee
2.  #include <iostream>
3.  using namespace std;
4.
5.  int main() {
6.      int* pta;
7.     int a=10;
8.     pta=&a;
9.     int b=5;
10.    int* ptb;
11.    ptb=&b;
12.    cout<<pta<<endl;
13.    cout<<ptb<<endl;
14.    cout<<pta-ptb<<endl;
15.    cout<<&b-&a<<endl;
16.
17.    return 0;// your code goes here
18. }
```

stdout

```
0xbfe4a828
0xbfe4a82c
-1
1
```

super keyword in JAVA

```
1.  class Vehicle{
2.    int speed=50;
3.  }
4.  class Bike3 extends Vehicle{
5.    int speed=100;
6.    void display(){
7.     System.out.println(speed);//will print speed of Bike
8.    }
9.    public static void main(String args[]){
10.    Bike3 b=new Bike3();
11.    b.display();
12. }
13. }
```

stdout

```
100
```

- https://ideone.com/xi2oPz

```
1.  class Vehicle{
2.    int speed=50;
3.  }
4.
5.  class Bike4 extends Vehicle{
6.    int speed=100;
7.
8.    void display(){
9.     System.out.println(super.speed);//will print speed of Vehicle now
10.   }
11.   public static void main(String args[]){
12.    Bike4 b=new Bike4();
13.    b.display();
14.
15. }
16. }
```

stdout

```
50
```

- https://ideone.com/yWPiOV

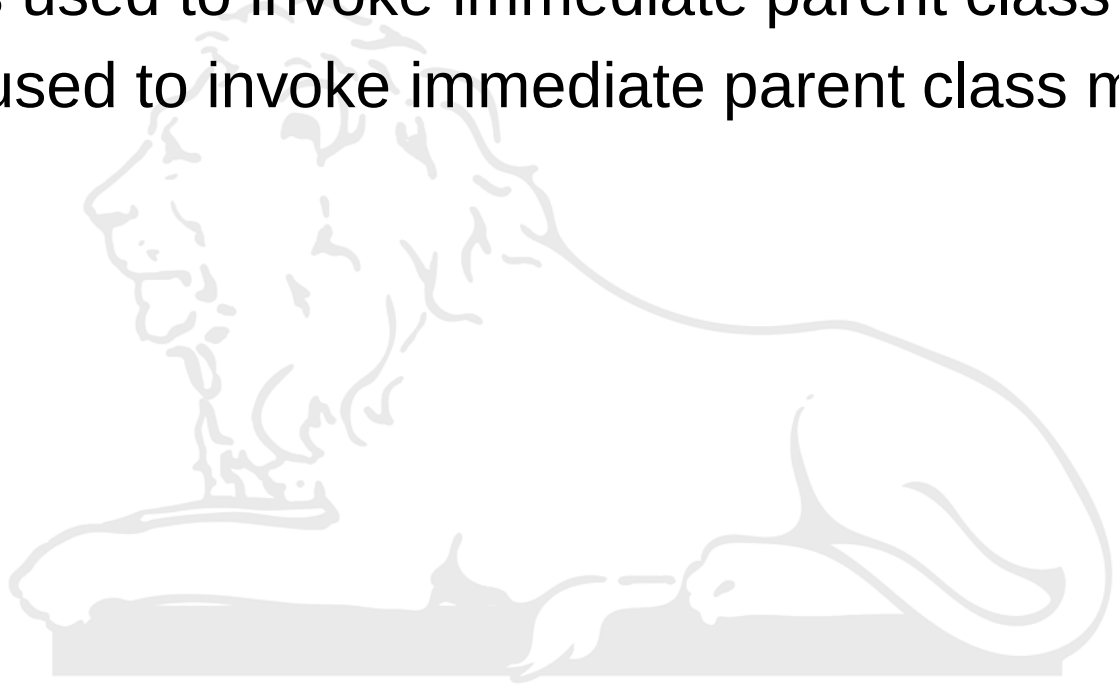
super keyword in java

- The **super** keyword in java is a reference variable that is used to refer immediate parent class object.

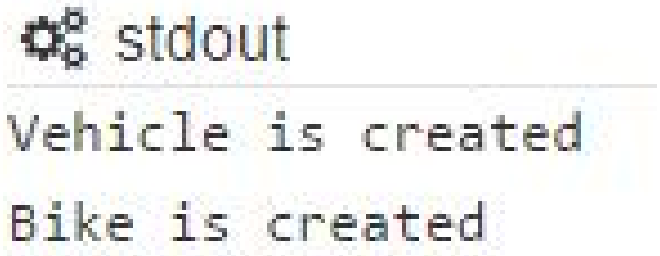
- Whenever you create the instance of subclass, an instance of parent class is created implicitly i.e. referred by super reference variable.

Usage of java super Keyword

- super is used to refer immediate parent class instance variable.
- super() is used to invoke immediate parent class constructor.
- super is used to invoke immediate parent class method.

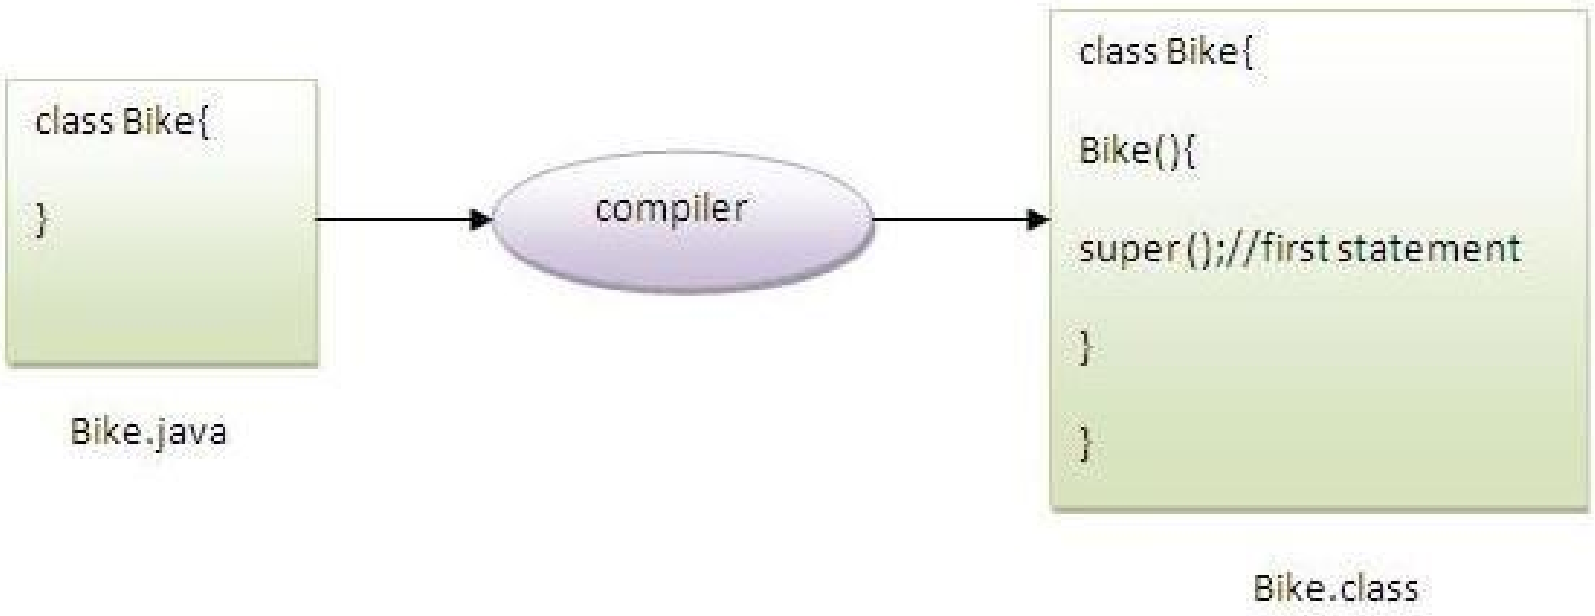


```
1.  class Vehicle{
2.    Vehicle(){System.out.println("Vehicle is created");}
3.  }
4.
5.  class Bike5 extends Vehicle{
6.    Bike5(){
7.     super();//will invoke parent class constructor
8.     System.out.println("Bike is created");
9.    }
10.   public static void main(String args[]){
11.    Bike5 b=new Bike5();
12.
13. }
14. }
```



- https://ideone.com/qx3zTd

- super() is added in each class constructor automatically by compiler.



```
1.  class Vehicle{
2.    Vehicle(){System.out.println("Vehicle is created");}
3.  }
4.
5.  class Bike5 extends Vehicle{
6.    Bike5(){
7.     //super();//will invoke parent class constructor
8.     System.out.println("Bike is created");
9.    }
10.   public static void main(String args[]){
11.    Bike5 b=new Bike5();
12.
13. }
14. }
```

stdout

```
Vehicle is created
Bike is created
```

- https://ideone.com/uu87Hk

Another example

```
1.  class Vehicle{
2.    Vehicle(){System.out.println("Vehicle is created");}
3.  }
4.
5.  class Bike6 extends Vehicle{
6.    int speed;
7.    Bike6(int speed){
8.      this.speed=speed;
9.      System.out.println(speed);
10.   }
11.   public static void main(String args[]){
12.    Bike6 b=new Bike6(10);
13.  }
14. }
```

stdout

```
Vehicle is created
10
```

- https://ideone.com/EBrcDW

super can be used to invoke parent class method

```
1.  //Example Program
2.  //CSN 103, IIT Roorkee
3.  class Person{
4.  void message(){System.out.println("welcome");}
5.  }
6.
7.  class Student16 extends Person{
8.  void message(){System.out.println("welcome to java");}
9.
10. void display(){
11. message();//will invoke current class message() method
12. super.message();//will invoke parent class message() method
13. }
14.
15. public static void main(String args[]){
16. Student16 s=new Student16();
17. s.display();
18. }
19. }
```

stdout

```
welcome to java
welcome
```

Program in case super is not required

```
1.  class Person{
2.  void message(){System.out.println("welcome");}
3.  }
4.
5.  class Student17 extends Person{
6.
7.  void display(){
8.  message();//will invoke parent class message() method
9.  }
10.
11. public static void main(String args[]){
12. Student17 s=new Student17();
13. s.display();
14. }
15. }
```

stdout

```
welcome
```

- https://ideone.com/idqe3T

```
1.  class Super_class{
2.
3.      int num=20;
4.
5.      //display method of superclass
6.      public void display(){
7.          System.out.println("This is the display method of superclass");
8.      }
9.
10. }
11.
```

```java
class Sub_class extends Super_class {

   int num=10;

   //display method of sub class
   public void display(){
      System.out.println("This is the display method of subclass");
   }

   public void my_method(){

      //Instantiating subclass
      Sub_class sub=new Sub_class();

      //Invoking the display() method of sub class
      sub.display();

      //Invoking the display() method of superclass
      super.display();

      //printing the value of variable num of subclass
      System.out.println("value of the variable named num in sub class:"+ sub.num);

      //printing the value of variable num of superclass
      System.out.println("value of the variable named num in super class:"+ super.num);
   }

   public static void main(String args[]){
      Sub_class obj = new Sub_class();
      obj.my_method();

   }
}
```

stdout

```
This is the display method of subclass
This is the display method of superclass
value of the variable named num in sub class:10
value of the variable named num in super class:20
```

https://ideone.com/6cVLNg

```
26.         //Invoking the display() method of sub class
27.         sub.display();
28.
29.         //Invoking the display() method of superclass
30.         super.display();
31.
32.         //printing the value of variable num of subclass
33.         System.out.println("value of the variable named num in sub class:"+ sub.num);
34.
35.         //printing the value of variable num of superclass
36.         System.out.println("value of the variable named num in super class:"+ super.num);
37.     }
38.
39.     public static void main(String args[]){
40.         Sub_class obj = new Sub_class();
41.         obj.my_method();
42.
43.     }
44. }
```

stdout

```
This is the display method of subcla
This is the display method of superc
value of the variable named num in s
value of the variable named num in s
```

https://ideone.com/6cVLNg

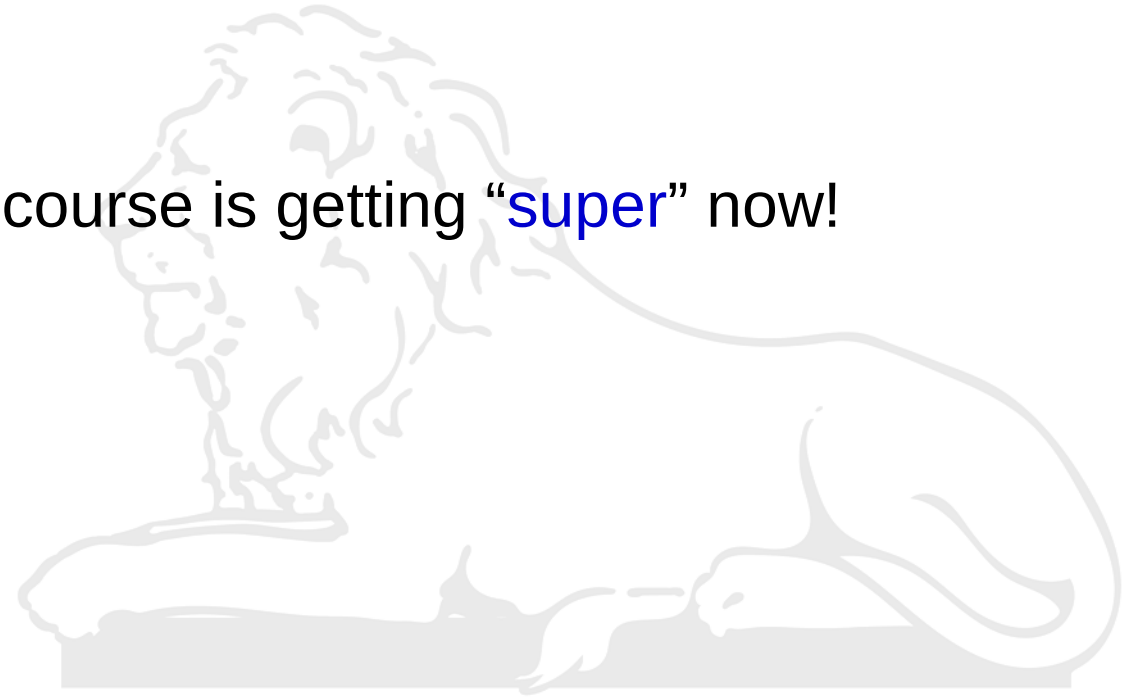
https://ideone.com/JLSHuN

```
1.  class Superclass{
2.
3.      int age;
4.
5.      Superclass(int age){
6.          this.age=age;
7.      }
8.
9.      public void getAge(){
10.         System.out.println("The value of the variable named age in super class is: " +age);
11.     }
12.
13. }
14.
15. class Subclass extends Superclass {
16.
17.     Subclass(int age){
18.         super(age);
19.     }
20.
21.     public static void main(String argd[]){
22.         Subclass s= new Subclass(24);
23.         s.getAge();
24.     }
25.
26. }
```

stdout

```
The value of the variable named age in super class is: 24
```

- You know “this” in Java
- You also know “super” in Java



- So “this” course is getting “super” now!
