

# Ambiguous to Unambiguous

PAGE NO.:

DATE: / /

- Ambiguity will be removed by precedence and associativity rules.

(a) If different operators are present, then the operator with higher precedence must be present below the lower precedence.

(precedence)

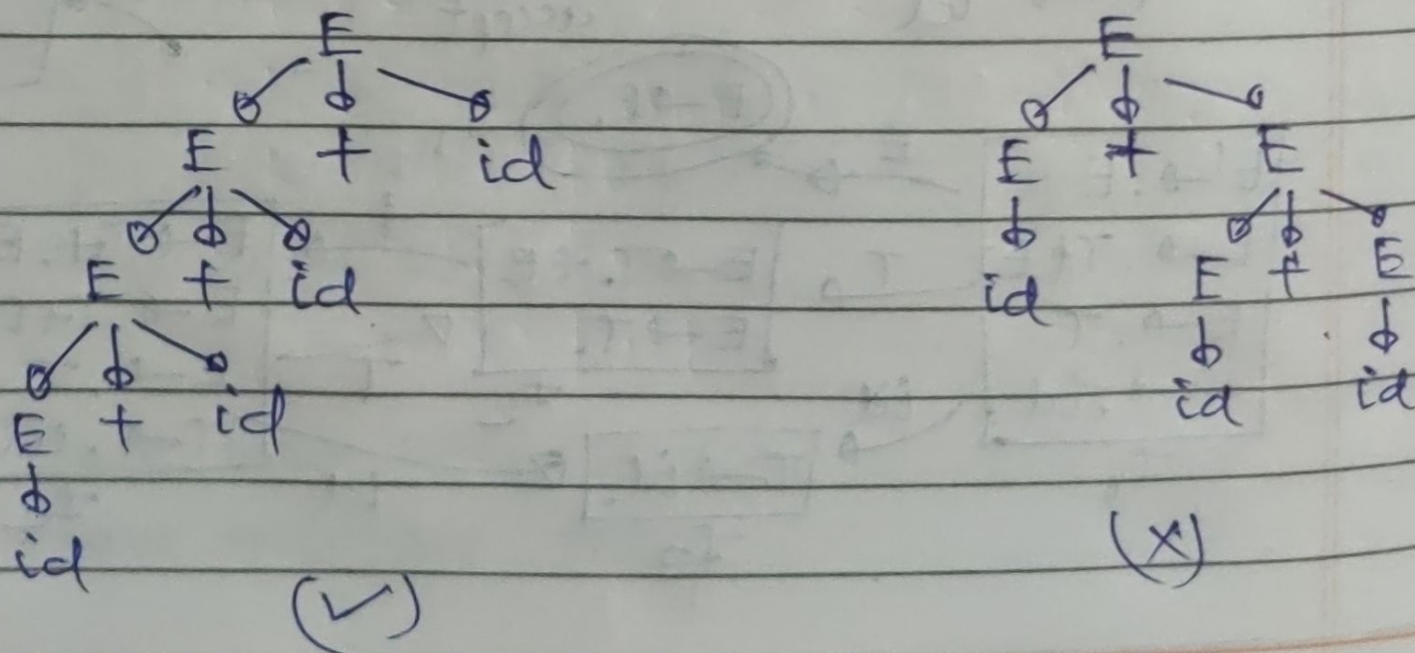

(b) If same operators are involved, then:

(i) for left to right associative operators, left recursion will be preferred

(ii) for right to left associative operators, right recursion will be preferred.

$\{ +, -, /, * \}$

$\{ \wedge \}$

Ex:-

(a)  $E \rightarrow E-E | id$

⇒ Only a left associative present; left recursion will be preferred :-

$E \rightarrow E-P | P$

$P \rightarrow id$

(D/R)

$E \rightarrow E-id(id$

(b)  $E \rightarrow E^{\wedge} E | id$

⇒ Right recursion will be preferred :-

$E \rightarrow P^{\wedge} E | P$

$P \rightarrow id$

(D/R)

$E \rightarrow id^{\wedge} E | id$

(c)  $E \rightarrow E+fE | E * E | id$

⇒  $\text{Precedence}(* ) > \text{Precedence}(+ ) \Rightarrow$  all the '+' operations be completed before '\*' operations.

⇒ Also left-recursion will be favoured for multiple '+' and '\*' operations:

$E \rightarrow E + T | T$

$T \rightarrow T * F | F$

$F \rightarrow id$

Ans

(d)  $E \rightarrow E-E | E * E | E^{\wedge} E | id$

⇒ '-' will be above '\*' and '\*' will be above '^' in the parse tree and hence :-

$$E \rightarrow E - T \mid T$$

$$T \rightarrow T * F \mid F$$

$$F \rightarrow P \wedge F \mid P$$

$$P \rightarrow \text{id}$$

}  $\rightarrow$  left recursion  
for  $\{-, *\}$

$\rightarrow$  right recursion  
for  $\wedge$

**Note**:- Take care that language generated by grammar mustn't change on removing ambiguity.

$$(d) \text{ bexp} \rightarrow \text{bexp} \text{ or } \text{bexp} \mid \text{bexp and bexp} \mid \text{not bexp} \mid \text{true} \mid \text{false}$$

$$\Rightarrow \text{bexp} \rightarrow \text{bexp} \text{ or } P \mid P$$

$$P \rightarrow P \text{ and } Q \mid Q$$

$$Q \rightarrow \text{not } Q \mid \text{true} \mid \text{false}$$

where "or", "and"  $\rightarrow$  left associative

and precedence =  $\{ \text{"not"} > \text{"and"} > \text{"or"} \}$

$$(e) R \rightarrow R + R \mid R . R \mid R * \mid a \mid b$$

$$\Rightarrow \text{Precedence} = * > . > +$$

$\Rightarrow$  '+' and '.' are left associative.

$$R \rightarrow R + P \mid P$$

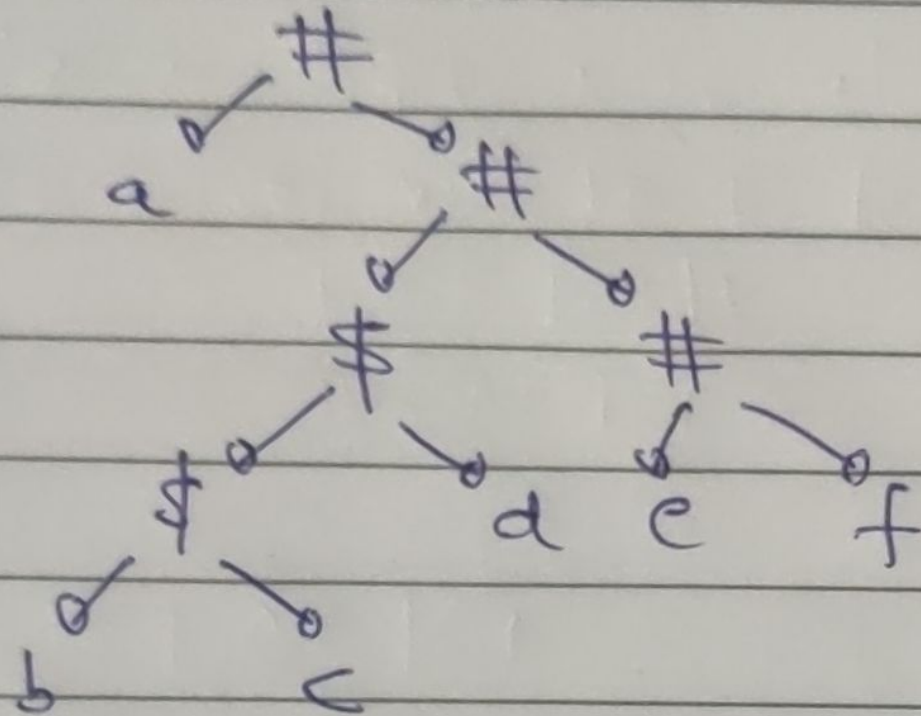

$$P \rightarrow P . Q \mid Q$$

$$Q \rightarrow a \mid a * \mid a \mid b$$

Ans

Example:- Consider string: "a # b \$ c \$ d # e # f"  
 Parse tree will be:

which tells that:

(a)  $\text{Precedence}(\$) > \text{Precedence}(\#)$

(b)  $\$ \rightarrow$  left associative

(c)  $\# \rightarrow$  right --||--
